Motivation: understanding the Rubik's cube

- How can we represent *operations* of a cube?
- How can we tell *how many* states a Rubik's cube can take?
- How can we better *understand* operations of a cube?

One answer: using permutations and computational group theory!

(J. A. Paulos, Innumeracy)

Ideal Toy Company stated on the package of the original Rubik cube that there were more than three billion possible states the cube could attain. It's analogous to McDonald's proudly announcing that they've sold more than 120 hamburgers.

Some basic group theory

Permutations

Definition (permutation)

Permutation of $[n] := \{1, \dots, n\}$ is bijection $\sigma : [n] \rightarrow [n]$.

Symmetric group $\text{Sym}(n)$ is set of permutations of $[n]$.

Write $1 = ()$ for identity. Write i^σ not $\sigma(i)$ for *image*.

Cycle notation: $\sigma = (1, 4, 5)(2, 6) \in \text{Sym}(6)$ is:

It means

$$1^\sigma = 4, 4^\sigma = 5, 5^\sigma = 1, 2^\sigma = 6, 6^\sigma = 2, 3^\sigma = 3.$$

Permutations (ii)

Product/composition: for $\sigma, \tau \in \text{Sym}(n)$, $\sigma\tau$ means “first σ , then τ ”, so $i^{\sigma\tau} = (i^\sigma)^\tau$. E.g. $\sigma = (1, 2, 3), \tau = (1, 3)(2, 4) \in \text{Sym}(4)$,

$$\sigma\tau = (1, 2, 3)(1, 3)(2, 4) = (1, 4, 2) \in \text{Sym}(4).$$

Note: here, $\sigma\tau \neq \tau\sigma$, since $1^{\sigma\tau} = 4$ but $1^{\tau\sigma} = (1^\tau)^\sigma = 3^\sigma = 1$. Identity $1 = ()$ satisfies $1\sigma = \sigma 1 = \sigma$ for $\sigma \in \text{Sym}(n)$.

Permutation groups

Note: for $g, h, k \in \text{Sym}(n)$, (i) $gh \in \text{Sym}(n)$, (ii) $1 = () \in \text{Sym}(n)$, (iii) $g^{-1} \in \text{Sym}(n)$, (iv) $(gh)k = g(hk)$. If true for subset:

Definition (permutation group)

Permutation group of degree n is subset $G \leq \text{Sym}(n)$ satisfying:

- (i) **(closure)** $gh \in G$ for $g, h \in G$;
- (ii) **(identity)** $1 = () \in G$;
- (iii) **(inverses)** $g^{-1} \in G$ for $g \in G$.

Example (alternating group)

Alternating group $\text{Alt}(3) = \{(), (1, 2, 3), (1, 3, 2)\} < \text{Sym}(3)$.

In general, $\text{Alt}(n)$ is all *even* permutations of $[n]$ (product of even # of *transpositions* (i, j) , e.g. $(1, 2, 3) = (1, 2)(1, 3)$).

Generating a group

Definition (generator)

Set X **generates** G if every $g \in G$ is $g = x_1^{\pm 1} \cdots x_r^{\pm 1}$ for some $r \in \mathbb{N}$, $x_i \in X$ **generators**; write $G = \langle X \rangle$.

(If $G = \langle X \rangle$ for some X with $|X| = 1$, G is **cyclic**.)

Example (cyclic group)

Consider $\text{Alt}(3) = \{(), (1, 2, 3), (1, 3, 2)\}$: $(1, 2, 3)^2 = (1, 3, 2)$, $(1, 2, 3)^3 = ()$, so $\text{Alt}(3) = \langle (1, 2, 3) \rangle$ is cyclic (only for $n = 3$).

Example (symmetric group)

Consider $\text{Sym}(3) = \{(), (1, 2), (1, 3), (2, 3), (1, 2, 3), (1, 3, 2)\}$.

Not cyclic, but $\text{Sym}(3) = \langle (1, 2), (2, 3) \rangle$ (adjacent swaps).

Also, $\text{Sym}(3) = \langle (1, 2), (1, 2, 3) \rangle$, e.g. $(2, 3) = (1, 2, 3)(1, 2)$.

Group actions

Definition (group action)

For permutation group G and set $\Omega \neq \emptyset$, a G -**action** is map $\Omega \times G \rightarrow \Omega$, $(\alpha, g) \mapsto \alpha^g$ s.t. $\alpha^1 = \alpha$ and $\alpha^{gh} = (\alpha^g)^h$ for $\alpha \in \Omega$ and $g, h \in G$.

Idea: $\alpha \in \Omega$ is *state*, apply *move* $g \in G$ to get state $\alpha^g \in \Omega$, in way that respects permutation product.

Example (natural action)

$G \leq \text{Sym}(n)$ acts on $\Omega = [n]$ by $\alpha^g := \alpha^g$ (image) for $\alpha \in [n]$, $g \in G$.

Example (right regular action)

Perm group G acts on $\Omega = G$ (itself) via $\alpha^g := \alpha g$ for $\alpha, g \in G$.

(Check: $\alpha^1 = \alpha 1 = \alpha$ and $\alpha^{gh} = \alpha(gh) = (\alpha g)h = (\alpha^g)^h$.)

Group actions (ii)

Example (dihedral group)

Let $r = (1, 2, 3, 4), s = (1, 4)(2, 3) \in \text{Sym}(4)$. **Dihedral group** is $D_8 := \langle r, s \rangle = \{1, r, r^2, r^3, s, sr, sr^2, sr^3\}$, “symmetries of square”.

Note: $sr = (2, 4), sr^2 = (1, 2)(3, 4)$. Action of D_8 on vertices of square (labelled by $[4]$): $g \in D_8$ sends vertex at i to i^g .

Definition (orbit)

If G acts on Ω , then **orbit** of $\alpha \in \Omega$ is $\alpha^G := \{\alpha^g : g \in G\}$.

Idea: states $\alpha^g \in \Omega$ reachable from fixed $\alpha \in \Omega$ by moves $g \in G$.

Definition (stabiliser)

If G acts on Ω , then **stabiliser** of $\alpha \in \Omega$ is $G_\alpha := \{g \in G : \alpha^g = \alpha\}$.

Idea: moves $g \in G$ that fix given $\alpha \in \Omega$.

Example (natural action)

$G = \text{Alt}(3) = \{(), (1, 2, 3), (1, 3, 2)\}$ acts on $\Omega = [3]$ naturally.

Orbit of 1 is $1^G = \{1, 2, 3\} = [3]$; stabiliser of 1 is $G_1 = \{()\} = 1$.

One orbit only: **transitive** action.

Orbits and stabilisers (ii)

Orbit α^G : states $\alpha^g \in \Omega$ reachable from fixed α by moves $g \in G$.

Stabiliser G_α : moves $g \in G$ that fix given α .

Example (dihedral group)

Recall $G = D_8 = \langle r, s \rangle = \{1, r, r^2, r^3, s, sr, sr^2, sr^3\} \leq \text{Sym}(4)$ where $r = (1, 2, 3, 4)$, $s = (1, 4)(2, 3)$.

Orbit of 1: $1^1 = 1$, $1^r = 2$, $1^{r^2} = 3$, $1^{r^3} = 4$, so $1^G = [4]$ (transitive).

Stabiliser of 1: $sr = (2, 4)$, $sr^2 = (1, 2)(3, 4)$, $sr^3 = (1, 3)$, so $G_1 = \{(), (2, 4)\} = \{1, sr\}$.

Note: $|1^G||G_1| = 4 \cdot 2 = 8 = |G|$. Coincidence?

Theorem (orbit-stabiliser)

If G acts on Ω , then for $\alpha \in \Omega$, $|\alpha^G||G_\alpha| = |G|$.

Definition (block)

If G acts transitively on Ω and $\Delta \subseteq \Omega$, let $\Delta^g := \{\alpha^g : \alpha \in \Delta\}$.

A **block** is $\Delta \subseteq \Omega$ with $\Delta^g = \Delta$ or $\Delta^g \cap \Delta = \emptyset$ for all $g \in G$.

Block is **nontrivial** if $|\Delta| > 1$ and $\Delta \neq \Omega$.

Examples of blocks: singletons, Ω , orbits.

For block Δ , define **block system** $\Sigma = \{\Delta^g : g \in G\}$ (partitions Ω).

Definition (primitivity)

A transitive G -action is **primitive** if there are no nontrivial blocks; otherwise it is **imprimitive**.

Dihedral group

The Rubik's group

Representing the cube and its operations

Rubik's cube has 6 faces, each with 3×3 small *stickers*.

In **solved state 1**, label stickers (except each centre) using [48]:

			1	2	3							
			4	U	5							
			6	7	8							
9	10	11	17	18	19	25	26	27	33	34	35	
12	L	13	20	F	21	28	R	29	36	B	37	
14	15	16	22	23	24	30	31	32	38	39	40	
			41	42	43							
			44	D	45							
			46	47	48							

6 **generators** (moves in CC): U, L, F, R, B, D (rot. clockwise).

Representing the cube and its operations (ii)

From *solved state 1*, consider F which rotates front face clockwise:

$$F = (17, 19, 24, 22)(18, 21, 23, 20)(6, 25, 43, 16)$$

$$(7, 28, 42, 13)(8, 30, 41, 11) \in \text{Sym}(48).$$

The Rubik's group of permutations

Generators as permutations of labels [48]:

- $U = (1, 3, 8, 6)(2, 5, 7, 4)(9, 33, 25, 17)(10, 34, 26, 18)(11, 35, 27, 19)$
- $L = (9, 11, 16, 14)(10, 13, 15, 12)(1, 17, 41, 40)(4, 20, 44, 37)(6, 22, 46, 35)$
- $F = (17, 19, 24, 22)(18, 21, 23, 20)(6, 25, 43, 16)(7, 28, 42, 13)(8, 30, 41, 11)$
- $R = (25, 27, 32, 30)(26, 29, 31, 28)(3, 38, 43, 19)(5, 36, 45, 21)(8, 33, 48, 24)$
- $B = (33, 35, 40, 38)(34, 37, 39, 36)(3, 9, 46, 32)(2, 12, 47, 29)(1, 14, 48, 27)$
- $D = (41, 43, 48, 46)(42, 45, 47, 44)(14, 22, 30, 38)(15, 23, 31, 39)(16, 24, 32, 40)$

Operation is sequence of generators and inverses. E.g. $RUR^{-1}U^{-1}$, $URU^{-1}L^{-1}UR^{-1}U^{-1}L$, $RUR^{-1}URU^2R^{-1}U^2$, $1 = ()$.

Definition (Rubik's group)

$\mathcal{G} = \langle U, L, F, R, B, D \rangle \leq \text{Sym}(48)$ is permutation group of degree 48, called **Rubik's group**.

Clearly \mathcal{G} is finite, but what is $|\mathcal{G}|$?

The Rubik's group of permutations (ii)

GAP code to define generators and $\mathcal{G} = \langle U, L, F, R, B, D \rangle$ (as G):

```
1 U := ( 1, 3, 8, 6)( 2, 5, 7, 4)( 9,33,25,17)(10,34,26,18)
      (11,35,27,19);;
2 L := ( 9,11,16,14)(10,13,15,12)( 1,17,41,40)( 4,20,44,37)(
      6,22,46,35);;
3 F := (17,19,24,22)(18,21,23,20)( 6,25,43,16)( 7,28,42,13)(
      8,30,41,11);;
4 R := (25,27,32,30)(26,29,31,28)( 3,38,43,19)( 5,36,45,21)(
      8,33,48,24);;
5 B := (33,35,40,38)(34,37,39,36)( 3, 9,46,32)( 2,12,47,29)(
      1,14,48,27);;
6 D := (41,43,48,46)(42,45,47,44)(14,22,30,38)(15,23,31,39)
      (16,24,32,40);;
7 G := Group( U, L, F, R, B, D );
```

Order cmd: $|\mathcal{G}| = 43\,252\,003\,274\,489\,856\,000 \approx 4.3 \cdot 10^{19}$. *How?*
